Screening of risk factors of personality by young drivers could be justified in some risk groups, where the recognition is in the competence of physician. Psychological diagnostics may be time- consuming and cost- less screening with a good effect on transport safety. We estimate 11-32% of young drivers are probability to have positive screening, and the diagnostics of psychological competence may be indicated even after the performance component in accordance with the "Syndrome of risk behavior during adolescence" as Rošková mentions (2013, In Mazánová, 2015, str. 18).
